

### IN THE CLAIMS

Please amend the claims as follows.

1. (Currently Amended) A method for forming a wafer, comprising:  
forming a predetermined contour in one of a semiconductor membrane and a substrate wafer, wherein the substrate wafer is a structure used in integrated circuit fabrication on which integrated circuits are formed; and  
bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane when the predetermined contour is straightened.
2. (Original) The method of claim 1, wherein the predetermined contour is straightened when the semiconductor membrane is bonded to the substrate wafer.
3. (Original) The method of claim 1, wherein the semiconductor membrane is bonded to the substrate wafer before the predetermined contour is straightened.
4. (Original) The method of claim 3, wherein bonding the semiconductor membrane to the substrate wafer includes performing a bond cut process to form the semiconductor membrane and to bond the membrane to the substrate wafer.
5. (Original) The method of claim 1, wherein upon bonding, the semiconductor membrane and the substrate wafer form a composite structure, the method further comprising bonding the composite structure to a carrier substrate.
6. (Original) The method of claim 1, wherein:  
forming a predetermined contour in one of a semiconductor membrane and a substrate wafer includes applying a pressure to flex the substrate wafer to have a predetermined strain; and

bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane includes:

bonding a periphery of the membrane to a periphery of the substrate wafer; and  
removing the pressure to relax the substrate wafer and transfer strain from the substrate wafer to the semiconductor membrane.

7. (Original) The method of claim 6, wherein applying a pressure to flex the substrate wafer to have a predetermined strain includes applying a pressure to a substrate wafer having a thickness sufficiently small such that the substrate wafer is flexible.

8. (Original) The method of claim 6, wherein applying a pressure to flex the substrate wafer to have a predetermined strain includes applying a pressure to a substrate wafer having voids such that the substrate wafer is flexible.

9. (Original) The method of claim 1, wherein:

forming a predetermined contour in one of a semiconductor membrane and a substrate wafer includes polishing a surface of a sacrificial wafer; and

bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane includes performing a bond cut process to form and bond the semiconductor membrane to the substrate wafer such that the bonding flattens and strains the semiconductor membrane.

10. (Original) The method of claim 1, wherein:

forming a predetermined contour in one of a semiconductor membrane and a substrate wafer includes forming a contoured surface in a crystalline wafer; and

bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane includes:

bonding the contoured surface to the wafer substrate; and  
polishing the crystalline wafer to thin the wafer and control strain in the crystalline wafer.

11. (Original) The method of claim 1, wherein the semiconductor membrane includes silicon.
12. (Original) The method of claim 1, wherein the substrate wafer is selected from the group comprising: glass, quartz, silicon oxycarbide glass, aluminum oxycarbide glass, and silicon.
13. (Original) The method of claim 1, wherein the semiconductor membrane includes an ultra-thin semiconductor layer.
14. (Original) The method of claim 1, wherein the semiconductor membrane is between approximately 300 Å to 1000 Å.
15. (Original) The method of claim 1, further comprising forming voids in the substrate wafer to provide the substrate wafer with a desired flexibility.
16. (Currently Amended) A method for forming a wafer, comprising:  
flexing a substrate wafer from a relaxed, straight position into a flexed position, wherein the substrate wafer is a structure used in integrated circuit fabrication on which integrated circuits are formed;  
bonding a portion of the substrate wafer to a semiconductor layer when the substrate wafer is in the flexed position; and  
relaxing the substrate wafer to induce a predetermined strain in the semiconductor layer.

17. (Original) The method of claim 16, wherein the semiconductor layer is an ultra-thin silicon membrane.
18. (Original) The method of claim 16, wherein the substrate wafer is selected from the group comprising: glass, quartz, silicon oxycarbide glass, aluminum oxycarbide glass, and silicon.
19. (Original) The method of claim 16, wherein the predetermined strain is within a range between approximately 0.75% and approximately 1.5%.
20. (Original) The method of claim 16, wherein the predetermined strain is within a range between approximately 1.0% and approximately 1.2%.
21. (Original) The method of claim 16, further comprising bonding a composite of the silicon membrane and the substrate wafer to a carrier wafer.
22. (Previously Presented) A method for forming a wafer, comprising:  
flexing a central region of a substrate wafer into a flexed position;  
bonding a peripheral region of the substrate wafer to a peripheral region of a silicon membrane and not bonding the silicon membrane to the central region of the substrate wafer when the substrate wafer is in the flexed position;  
relaxing the substrate wafer to induce a predetermined strain in the silicon membrane.
23. (Original) The method of claim 22, wherein relaxing the substrate wafer to induce a predetermined strain in the silicon membrane includes inducing a strain in the silicon membrane greater than 0.5%.
24. (Original) The method of claim 22, wherein relaxing the substrate wafer to induce a predetermined strain in the silicon membrane includes inducing a strain in the silicon membrane within a range between approximately 0.75% to approximately 1.5%.

- 
25. (Original) The method of claim 22, wherein relaxing the substrate wafer to induce a predetermined strain in the silicon membrane includes inducing a strain in the silicon membrane between approximately 1% to approximately 1.2%.
26. (Original) The method of claim 22, further comprising bonding a composite of the silicon membrane and the substrate wafer to a carrier wafer.
27. (Original) The method of claim 22, wherein the semiconductor layer is an ultra-thin silicon membrane.
28. (Original) A method for forming a wafer, comprising:  
flexing a central region of a substrate wafer into a flexed position;  
performing a bond cut process to form a silicon membrane from a crystalline sacrificial wafer and bond a peripheral region of the substrate wafer to a peripheral region of a silicon membrane when the substrate wafer is in the flexed position; and  
relaxing the substrate wafer to induce a predetermined strain in the silicon membrane.
29. (Original) The method of claim 28, wherein performing a bond cut process includes:  
defining the silicon membrane in a surface layer of a sacrificial crystalline silicon wafer;  
bonding the surface layer of the sacrificial wafer to the peripheral region of the substrate wafer;  
heat-treating the sacrificial wafer and the substrate wafer; and  
separating the sacrificial wafer from the membrane such that the silicon membrane remains strongly bonded to the substrate wafer.
30. (Previously Presented) The method of claim 29, wherein:  
defining a crystalline silicon membrane in a surface layer of a sacrificial crystalline semiconductor wafer includes implanting helium ions into the sacrificial wafer to form cavities along a cleavage plane; and

heat-treating the sacrificial wafer and the substrate wafer combines cavities along the cleavage plane such that the sacrificial wafer is separated from the silicon membrane along the cleavage plane.

31. (Original) A method for forming a wafer, comprising:
- forming voids in a substrate wafer to provide the substrate wafer with a desired flexibility;
  - flexing the substrate wafer into a flexed position;
  - bonding a portion of the substrate wafer to a semiconductor membrane when the substrate wafer is in the flexed position; and
  - relaxing the substrate wafer to induce a predetermined strain in the semiconductor membrane.
32. (Original) The method of claim 31, wherein the semiconductor membrane includes a silicon membrane having a thickness between approximately 300 Å and approximately 1000 Å, and the predetermined strain is within a range between approximately 0.75% and approximately 1.5%.
33. (Original) The method of claim 31, wherein forming voids in a substrate wafer includes forming a predetermined arrangement of voids using a surface transformation process.
34. (Original) The method of claim 31, wherein bonding a portion of the substrate wafer to a semiconductor membrane includes performing a bond cut process.
35. (Original) The method of claim 31, wherein forming voids in a substrate wafer includes forming holes in a substrate wafer having a well-defined melting temperature, and annealing the substrate wafer at a temperature that is close to and below the well-defined melting temperature.

36. (Original) The method of claim 31, wherein forming voids in a substrate wafer includes forming spherical voids using a surface transformation process, each of the spherical voids being a predetermined size and being positioned at a predetermined location.

37. (Original) The method of claim 31, wherein forming voids in a substrate wafer includes forming pipe-shaped voids using a surface transformation process, each of the pipe-shaped voids being a predetermined size and being positioned at a predetermined location.

38. (Original) The method of claim 31, wherein forming voids in a substrate wafer includes forming plate-shaped voids using a surface transformation process, each of the plate-shaped voids being a predetermined size and being positioned at a predetermined location.

39. (Currently Amended) A method for forming a wafer, comprising:  
forming a convex contour in a surface of a sacrificial crystalline wafer; and  
performing a bond cut process to form an ultra-thin semiconductor membrane and bond the ultra-thin semiconductor membrane to a substrate wafer, wherein the ultra-thin semiconductor membrane is flattened into a flattened position and strained in the flattened position when bonded to the substrate wafer.

40. (Original) The method of claim 39, wherein the ultra-thin semiconductor membrane includes a silicon membrane.

41. (Original) The method of claim 39, wherein performing a bond cut process includes:  
defining the semiconductor membrane in a surface layer of a sacrificial crystalline silicon wafer;  
bonding the surface layer of the sacrificial wafer to the peripheral region of the substrate wafer;  
heat-treating the sacrificial wafer and the substrate wafer; and  
separating the sacrificial wafer from the semiconductor membrane such that the semiconductor membrane remains strongly bonded to the substrate wafer.

42. (Original) The method of claim 39, wherein:

defining a crystalline semiconductor membrane in a surface layer of a sacrificial crystalline semiconductor wafer includes implanting helium ions into the sacrificial wafer to form cavities along a cleavage plane; and

heat-treating the sacrificial wafer and the substrate wafer combines cavities along the cleavage plane such that the sacrificial wafer is separated from the semiconductor membrane along the cleavage plane.

43. (Currently Amended) A method for forming a wafer, comprising:

forming a concave surface in a crystalline wafer;

bonding the concave surface of the crystalline wafer to a flat substrate wafer to flatten the concave surface into a flattened position to induce a strain in the crystalline wafer in the flattened position; and

polishing the bonded crystalline wafer to thin the crystalline wafer and control the induced strain.

44. (Currently Amended) A method of forming a transistor, comprising:

straining a semiconductor layer to form a strained semiconductor layer, including:

forming a predetermined contour in one of a semiconductor layer and a substrate wafer; and

bonding the semiconductor layer to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor layer when the predetermined contour is straightened;

forming a gate separated from the strained semiconductor layer by a gate insulator; and

forming first and second diffusion regions separated by a channel region, the strained semiconductor layer including the first and second diffusion region and the channel region.

45. (Original) The method of claim 44, wherein the semiconductor layer is wafer-sized.

46. (Original) The method of claim 44, wherein:

forming a predetermined contour in one of a semiconductor layer and a substrate wafer includes applying a pressure to flex the substrate wafer to have a predetermined strain; and bonding the semiconductor layer to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor layer includes: bonding a periphery of the semiconductor layer to a periphery of the substrate wafer; and removing the pressure to relax the substrate wafer and transfer strain from the substrate wafer to the semiconductor layer.

47. (Previously Presented) A method of forming a transistor, comprising:

forming a strained silicon membrane on a substrate wafer, including: flexing a central region of the substrate wafer into a flexed position; bonding a peripheral region of the substrate wafer to a peripheral region of the silicon membrane and not bonding the silicon membrane to the central region of the substrate wafer when the substrate wafer is in the flexed position; and relaxing the substrate wafer to induce a predetermined strain in the silicon membrane; forming a gate separated from the strained silicon membrane by a gate insulator; and forming first and second diffusion regions separated by a channel region, the strained silicon membrane including the first and second diffusion region and the channel region.

48. (Original) The method of claim 47, wherein the strained silicon membrane is wafer-sized.

49. (Original) The method of claim 47, wherein the substrate wafer has a thickness sufficiently small such that the substrate wafer has a desired flexibility.

50. (Original) The method of claim 49, further comprising bonding a composite of the substrate wafer and the silicon membrane to a carrier substrate.
51. (Original) The method of claim 47, further comprising forming voids in the substrate wafer such that the substrate wafer has a desired flexibility.
52. (Previously Presented) A method of forming a memory array, comprising:  
forming a substrate with a strained silicon layer, including:  
flexing a central region of a substrate wafer into a flexed position;  
bonding a peripheral region of the substrate wafer to a peripheral region of the silicon layer and not bonding the silicon membrane to the central region of the substrate wafer when the substrate wafer is in the flexed position; and  
relaxing the substrate wafer to induce a predetermined strain in the silicon layer;  
forming a plurality of memory cells using the strained silicon layer, including arranging the memory cells in rows and columns and forming at least one transistor for each of the plurality of memory cells, wherein forming at least one transistor includes:  
forming a gate separated from the strained silicon layer by a gate insulator; and  
forming first and second diffusion regions separated by a channel region, the strained silicon layer including the first and second diffusion region and the channel region;  
forming a plurality of word lines, including connecting each word line to a row of memory cells; and  
forming a plurality of bit lines, including connecting each bit line to a column of memory cells.
53. (Currently Amended) A method for forming an electronic system, comprising:  
forming a strained semiconductor layer, including:  
forming a predetermined contour in one of a semiconductor layer and a substrate wafer; and

bonding the semiconductor layer to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor layer when the predetermined contour is straightened;

forming a processor and forming a memory device in communication with the processor, wherein forming a processor and forming a memory device includes forming at least one transistor with a channel region formed by the strained semiconductor layer.

Claims 54-65. (Canceled)

66. (Previously Presented) A method for forming a wafer, comprising:
- forming a predetermined contour in one of a semiconductor membrane and a substrate wafer; and
  - bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane, wherein:
    - forming a predetermined contour in one of a semiconductor membrane and a substrate wafer includes applying a pressure to flex the substrate wafer to have a predetermined strain;
    - bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane includes:
      - bonding a periphery of the membrane to a periphery of the substrate wafer; and
      - removing the pressure to relax the substrate wafer and transfer strain from the substrate wafer to the semiconductor membrane; and
    - applying a pressure to flex the substrate wafer to have a predetermined strain includes applying a pressure to a substrate wafer having voids such that the substrate wafer is flexible.

67. (Previously Presented) A method for forming a wafer, comprising:  
forming voids in a substrate wafer to provide the substrate wafer with a desired flexibility;  
forming a predetermined contour in one of a semiconductor membrane and the substrate wafer; and  
bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane.
68. (Previously Presented) A method for forming a wafer, comprising:  
flexing a central region of a substrate wafer into a flexed position;  
performing a bond cut process to form a silicon membrane from a crystalline sacrificial wafer and bond a peripheral region of the substrate wafer to a peripheral region of a silicon membrane when the substrate wafer is in the flexed position; and  
relaxing the substrate wafer to induce a predetermined strain in the silicon membrane, wherein:  
performing a bond cut process includes:  
defining the silicon membrane in a surface layer of a sacrificial crystalline silicon wafer;  
bonding the surface layer of the sacrificial wafer to the peripheral region of the substrate wafer;  
heat-treating the sacrificial wafer and the substrate wafer; and  
separating the sacrificial wafer from the membrane such that the silicon membrane remains strongly bonded to the substrate wafer.  
defining a crystalline silicon membrane in a surface layer of a sacrificial crystalline semiconductor wafer includes implanting helium ions into the sacrificial wafer to form cavities along a cleavage plane; and  
heat-treating the sacrificial wafer and the substrate wafer combines cavities along the cleavage plane such that the sacrificial wafer is separated from the silicon membrane along the cleavage plane.

69. (Previously Presented) A method for forming a wafer, comprising:
- forming a convex contour in a surface of a sacrificial crystalline wafer; and
  - performing a bond cut process to form an ultra-thin semiconductor membrane and bond the ultra-thin semiconductor membrane to a substrate wafer, wherein the ultra-thin semiconductor membrane is flattened and strained when bonded to the substrate wafer,
- wherein:
- defining a crystalline semiconductor membrane in a surface layer of a sacrificial crystalline semiconductor wafer includes implanting helium ions into the sacrificial wafer to form cavities along a cleavage plane; and
  - heat-treating the sacrificial wafer and the substrate wafer combines cavities along the cleavage plane such that the sacrificial wafer is separated from the semiconductor membrane along the cleavage plane.
70. (New) A method for forming a wafer, comprising:
- forming a predetermined contour in one of a semiconductor membrane and a substrate wafer, wherein the substrate wafer is a structure used in integrated circuit fabrication on which integrated circuits are formed; and
  - bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane.
- bonding the semiconductor membrane to the substrate wafer includes performing a bond cut process to form the semiconductor membrane and to bond the membrane to the substrate wafer,
- wherein the semiconductor membrane is bonded to the substrate wafer before the predetermined contour is straightened, and bonding the semiconductor membrane to the substrate wafer includes performing a bond cut process to form the semiconductor membrane and to bond the membrane to the substrate wafer.

71. (New) A method for forming a wafer, comprising:

forming a predetermined contour in one of a semiconductor membrane and a substrate wafer, wherein the substrate wafer is a structure used in integrated circuit fabrication on which integrated circuits are formed; and

bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane,

wherein forming a predetermined contour in one of a semiconductor membrane and a substrate wafer includes polishing a surface of a sacrificial wafer, and bonding the semiconductor membrane to the substrate wafer and straightening the predetermined contour to induce a predetermined strain in the semiconductor membrane includes performing a bond cut process to form and bond the semiconductor membrane to the substrate wafer such that the bonding flattens and strains the semiconductor membrane.
